

Blood Konnector - Lifeline Panel (Recipient Dashboard Specification)

Overview

The Lifeline Recipient Dashboard is designed for users who require regular or emergency blood donations. This dashboard enables them to manage recurring blood needs, schedule donations, track confirmations, communicate with donors, and provide feedback on completed donations. It is an exclusive panel for verified recipients registered under the Blood Konnector Lifeline program.

Dashboard Sections

- **1. Dashboard Overview** — Displays a summary of the recipient's current status: active donation requests, upcoming confirmed donations, pending confirmations, and total successful donations. Includes analytics of donation frequency and availability tracking.
- **2. Lifeline Profile & Verification** — Contains verified medical records, hospital information, and emergency contacts. Allows updates to hospital preference, required blood type, and frequency of need (e.g., weekly, bi-weekly, monthly).
- **3. Create Donation Request** — Recipients can create a new donation request specifying hospital, city, date, time, and urgency level. Once submitted, the system matches potential donors from the verified donor pool.
- **4. Request Confirmation System** — After discussion with a donor in chat, the system asks the recipient to confirm if the donor has agreed to donate. If confirmed, the system automatically asks for final details (date, time, and location). If not confirmed, the request remains open for other donors.
- **5. Scheduled Donations** — Displays confirmed upcoming donations with countdown timers. Automated reminders are sent to both parties 24 hours, 3 hours, and 30 minutes before the donation time.
- **6. Chat & Communication Center** — Allows secure conversation between the recipient and donor before donation. After the chat ends, the system triggers the confirmation sequence automatically.
- **7. Notification Center** — All updates (new donor offers, confirmation requests, countdown alerts, and reschedules) appear in this section. Recipients are required to respond to system prompts within 12 hours, or requests auto-expire.
- **8. Donation Feedback** — After a scheduled donation time passes, the system asks: 'Did you receive the blood donation?' Recipient options: Yes / No / Reschedule. If 'Yes', the system logs it as a successful donation. If 'No', it's logged as failed. If 'Reschedule', recipient can choose a new date, time, and location, and donor is re-contacted.
- **9. History & Reports** — Lists all completed, failed, and rescheduled donations. Includes donor details, hospital, and timestamps. Also shows analytics like average fulfillment time and success rate.

- **10. Support & Medical Verification** — Includes contact support, medical verification submission, and hospital coordination panel for transparency.

Additional System Behaviors

- ■ 12-hour response timeout: All confirmation prompts must be responded to within 12 hours.
- ■ Notification types: Push + Email reminders for confirmations, countdowns, and post-donation feedback.
- ■ Admin synchronization: Admin dashboard receives real-time data of recipient activity, pending confirmations, and feedback.
- ■ Feedback collection: Both recipient and donor feedback are stored for trust score analytics.
- ■ Rescheduling logic: System automatically resets countdowns and notifications after each reschedule approval.
- ■ Smart matching: Lifeline system prioritizes previously successful donors for repeat requests when available.
